A-Z Beekeeping with the Slovenian Hive Janko Bozic 2017-04-20 This is not a miracle hive, one more from many. It is proven and survived concept from the country with old beekeeping tradition, from the country that gave first governmental beekeeping teacher in the Central Europe and that had live contacts over the ocean with exchange of beekeeping experts as well involvement in main spread of well know Carniolan bee. The original hive design was developed during direct experience with the American way of beekeeping at the end of 19th century, but slowly introduced at the beginning of 20th century. It overrode all other concept and with some new innovations is staying well alive also between Slovenian professional beekeepers. The book is a result of old wish to describe Slovenian way of beekeeping and finally encouraged by urgent need of modern adopters from USA. It was long time ago that I prepared simple description with some drawings of Slovenian AZ hive at University web pages. From time to time some contacted me for additional explanation. Until recently I didn't have enough courage to focus on writing a comprehensive book or at list booklet that could help beekeepers that understand English, to try with Slovenian way of beekeeping. Actually two beekeepers from USA, Suzanne and Mark started with our hives nearly independently and close one to each other. One with previous leaving experience in Slovenia, the other with ancestors in Slovenia, both fell in love with Slovenia first, and later recognized special beauty of Slovenian way of beekeeping. Both approached to help in their future endower. Mark

soon came with idea that early adopters of AZ hive will need some kind of user guide. So we had several meetings when he visited Slovenia and made master plan. That was how this book started to become basic help for nowadays beekeepers that want to use a hive that enables them farther enjoyment regardless of obstacles that arrives with aging or other reasons. You will be able to find basic information how the hive looks like and how to start beekeeping in Slovenian way. My special emphases is on a bee house which I count for a beekeeper as a "bee chapel." Our hives are very suited for such arrangements. I have written above statements without my American friend William Blomstedt, who helped out to put my thoughts in readable English. You might remember him from reading his beekeeping articles from his experience with beekeeping around the World, also Slovenia. Special thanks to William and all who encouraged me and helped in preparing this second edition!

Langstroth 2004-01-01 This influential guide by "the father of modern beekeeping," originally published in 1853, constitutes the first descriptive treatise of modern bee management. Its innovations allowed people to engage in actual beekeeping, rather than simply handling bee domiciles and extracting the honey. In a reader-friendly, enthusiastic style, Langstroth addresses every aspect of beekeeping: bee physiology; diseases and enemies of bees; the life-cycles of the queen, drone, and worker; bee-hives; the handling of bees; and many other topics. Natural Beekeeping Ross Conrad 2013-03-08 Today's beekeepers face unprecedented challenges, a fact that is now front-page news with the spread of "colony collapse disorder." In fact, there is evidence that chemical treatments are making matters worse. It's time for a new approach. Now revised and updated with new resources and including full-color photos throughout, Natural Beekeeping offers all the latest information in a book that has already proven invaluable for organic beekeepers. The new edition offers the same holistic, sensible alternative to conventional chemical practices with a program of natural hive management, but offers new sections on a wide range of subjects, including: The basics of bee biology and anatomy Urban beekeeping Identifying and working with queens Parasitic mite control Hive diseases Also, a completely new chapter on marketing provides valuable advice for anyone who intends to sell a wide range of hive products. Ross Conrad brings together the best "do no harm" strategies for keeping honeybees healthy and productive with nontoxic methods of controlling mites; eliminating American foulbrood disease without the use of antibiotics; selective breeding for naturally resistant bees; and many other detailed management techniques, which are covered in a thoughtful, matter-of-fact way. The Key Elements of Natural Organic Beekeeping Dragos Negru 2019-09-26 A Practical Guide to Natural Beekeeping in Multi-Layer Hives from Setting Up a Colony to Hive Management and Harvesting the Honey, New Scientific Innovations, Holistic Queen Rearing and Breeding, Apitherapy. Organic Beekeeping, Natural Beekeeping, Modern Holistic Beekeeping, Raw Honey, Natural Combs, NO Chemicals, NO Artificial Combs. During this entire original writing, he captures in an enjoyable way the new integral approach, the "HOLISTIC" approach, of the complex and age-old practice of beekeeping. Starting from the performance of the biological dynamics of bee colonies in nature, the author, preserving the standard dimension of a Langstroth-type frame as a main basic element of conventional beekeeping techniques introduces for the very first time the idea of the "Maximus System" and the Maximus technique, which relies on matrix reporting natural principles, thus integrating the matrix into the working system. The Maximus System is different from other classical systems of beekeeping; through the use of specific methods, it is oriented towards the real, actual needs of the bee colonies, in direct connection with both the material and the universal laws governing matter and substance. It is characterized as a "HOLISTIC System" and introduces for the first time the "MATRIX Concept." This is an "intangible abstract element, belonging to subtle plans," as defined by the author, representing the very basis of the life of a bee colony. With a view to assessing what happens at a certain point in the bee colony, the

author introduces the "eloquent honeycomb method," which consists of introducing an empty frame into the hive without an artificial comb attached to it, where, by liaising to the matrix, the bees will build up in a few days (or not) a natural comb from bottom up, with differentiated cells in which the queen bee will lay eggs (or not). Depending on these events, we will be able to "read" the actual status of the colony in question. Using this method, the author emphasizes for the first time a new type of cells built by bees, which he calls conversion cells. He provides designs for new preservation and maintenance methods and techniques throughout the year, queen bees' natural selection and breeding methods, and disease prevention and prophylaxis methods, thus explaining in complete detail the complex activities that beekeepers need to perform in an apiary. In this book there are for certain at least five patents related to procedures, methods, and devices of utmost international scientific importance in the original scientific content of this specialized work. For all these scientific innovations, as well as for the new HOLISTIC complex and complete approach in the field of beekeeping, upon the proposition of the Scientific Researcher of 2nd level George Florea TOBA, Ph.D., the author is granted the title of Honorary Scientific Researcher within the Professor David Davidescu Biodiversity Research and Studies Center.

Constructive Beekeeping Ed. H. Clark 2014-04-12 CONSTRUCTIVE BEEKEEPING: The Classic Guide for the Practical Beekeeper provides expert instructions on building and maintaining beehives, offering detailed and easy to follow techniques for all phases of honey production with specific emphasis on temperature, wind, moisture, evaporation, sunshine, altitude and fostering the fertility and vigor of the queen. "Bees always respond to similar treatment under like conditions by giving uniform results. The beekeepers' trouble is that he makes his treatments uniform but not his conditions." "Commercial beekeeping has for its object the production of the maximum quantity of well ripened honey at a minimum of cost. Swarming adds greatly to the cost of producing honey. Most methods of swarm-prevention have in them the element of destructiveness. Ventilating, removing the queen, shaking the bees, removing the brood, exchanging brood-bodies, loosening the cover, all destroying something that the bees have done,

or adding to the work to be done in the hive. Let me state here that you are not going to be told that absolute swarm-prevention is a possibility, nor will you be told that honey can be produced by absent treatment. What you will get from a good understanding of the following pages is that the beekeeper who takes advantage of the laws relating to condensation of vapor, and follows where the bees have been leading will have advanced one step nearer the swarm less bee. Instead of going to the hive and telling the bees (by manipulations) "don't do this" ; say to them "keep all your brood, keep your queen, keep the cold damp air out of the hive and I will make your hive so perfect a condenser of water vapor that the work of evaporating water from the nectar will be done quickly." We will bring team-work into play, and each get the benefit of every advantage gained. Constructive beekeeping helps by getting the honey ripened quickly each night and stored out of the way of the queen. The hive will then be maintained in such a condition that the bees have the greatest amount of comfort in relation to the results produced." "When we compare evaporation by the aid of ventilation with that which takes place aided by condensation, and give this an application of the laws of heat, with its three ways of communication; conduction, convection and radiation, the tension of vapors; and the stillness, dryness and density of the atmosphere, our conclusion must be that condensation is so uniform in its results, that it eliminates everything ascribed to locality, but the number of flowers and the weather conditions that affect the flight of bees and the flow of nectar. All other Conditions, by the aid of condensation, can be controlled by the beekeeper. Ventilation and shade each make more room in the hive, but not with uniformity under all conditions; So we must add to the treatments we give the bees, a well varnished inner surface to the hive, and a cover that, at no time, permits of upward ventilation. Then the bees will be able to keep the nectar out of the way of a queen, whose egg-laying capacity is increasing daily. Room, and the procedure whereby the bees automatically make more room as they need it, is the single thing that we have to consider in urge prevention."

The Classic Guide to Beekeeping John Hunter 2015-09-15 A comprehensive period guide to beekeeping,

from hives to honey, including a small selection of recipes.

Beekeeping & Self Sufficiency Michael Manning 2013-09-05 Bees are vital for the pollination of fruit and vegetables representing 70% of food produced for mankind's consumption. Bees are industrious, devoted to the well being of the hive and can be managed by beekeepers to produce honey which is stored by the bees for surviving the winter dormancy period.

The Complete Guide to Beekeeping for Fun & Profit Cindy Belknap 2010 Beekeeping is both a hobby and a practical business plan that many individuals have taken up in recent years as a viable way to culture a valuable natural resource and have fun in the process. In any given year, an effectively built beekeeping business can bring profits up to 500 percent of your investment according to numerous private beekeepers. The benefit of growing your own honey and selling it to local customers for between \$3 and \$6 a pound depending on how you cultivate and whether your honey is completely organic can be a huge boon for anyone with the money and time to invest. Initiation and Practice in Modern Holistic Beekeeping Dragos Ciprian Negru 2016-03-28 Dr. Negru is the author of this valuable work, based upon his own personal experience acquired during more than twelve years of research in the field of organic and natural preservation of bee colonies. During this entire original writing, he captures in an enjoyable way the new integral approach, the "HOLISTIC" approach, of the complex and age-old practice of beekeeping. Starting from the performance of the biological dynamics of bee colonies in nature, the author, preserving the standard dimension of a Langstroth-type frame as a main basic element of conventional beekeeping techniques introduces for the very first time the idea of the "Maximus System" and the Maximus technique, which relies on matrix reporting natural principles, thus integrating the matrix into the working system. The Maximus System is different from other classical systems of beekeeping; through the use of specific methods, it is oriented towards the real, actual needs of the bee colonies, in direct connection with both the material and the universal laws governing matter and substance. It is characterized as a "HOLISTIC System" and introduces for the first time the "MATRIX Concept." This is an "intangible abstract element, belonging to subtle plans," as defined by the author, representing the very basis of the life of a bee colony. With a view to assessing what happens at a certain point in the bee colony, the author introduces the "eloquent honeycomb

method," which consists of introducing an empty frame into the hive without an artificial comb attached to it, where, by liaising to the matrix, the bees will build up in a few days (or not) a natural comb from bottom up, with differentiated cells in which the queen bee will lay eggs (or not). Depending on these events, we will be able to "read" the actual status of the colony in question. Using this method, the author emphasizes for the first time a new type of cells built by bees, which he calls conversion cells. He provides designs for new preservation and maintenance methods and techniques throughout the year, queen bees' natural selection and breeding methods, and disease prevention and prophylaxis methods, thus explaining in complete detail the complex activities that beekeepers need to perform in an apiary. In this book there are for certain at least five patents related to procedures, methods, and devices of utmost international scientific importance in the original scientific content of this specialized work. For all these scientific innovations, as well as for the new HOLISTIC complex and complete approach in the field of beekeeping, upon the proposition of the Scientific Researcher of 2nd level George Florea TOBA, Ph.D., the author is granted the title of Honorary Scientific Researcher within the Professor David Davidescu Biodiversity Research and Studies Center.
